DELIVERIES BY FREIGHT

In these times of war it becomes the principal duty of the Railroads to see that all men and material essential to our war effort move and move without delay. As a result there is apt to be some delays in commercial freight shipments. Place your order early and be assured to have your seeds on hand when needed.

Truck Service. New Orleans enjoys splendid truck service in all directions. To many points shipments by truck are more convenient and will move faster than freight. Rates are about the same.

EXPRESS & RUSH SHIPMENTS

If at any time you require rapid service and want your seeds at once, specify Express. Many special low Express rates apply to many points. Ask your Express Agent how much it will cost. He will gladly tell you.

For 65 years Reuter has steadfastly adhered to the highest standards of quality. No effort or expense is spared to furnish our many customers with the best. Even with the highest quality seeds, bulbs and plants, success in gardening or farming depends largely upon cultivation, soil and weather conditions. Therefore, in common with the universal custom of the Seed Trade, Reuter Seed Company, Inc., will not be in any way responsible for the crop. Our seeds, plants and bulbs are guaranteed to be exactly as represented, and in condition to grow satisfactorily if planted and cared for properly. Any single item not found to be entirely satisfactory will be replaced absolutely free of charge, or we will refund you every cent you paid, including transportation charges both ways.

Reuter operates its own modern seed laboratory in charge of a graduate Seed Analyst, formerly with the United States Government. Every lot of seed is painstakingly analyzed for purity and carefully tested for germination. Tests are also conducted in our large greenhouses, and finally checked under our personal supervision at our experimental farm. All seed must measure up to Reuter's rigid specifications, otherwise it is not shipped to you.

LARGEST COMPLETE STOCKS

Reuter places at your disposal the largest, finest and most complete stock of vegetable, farm and flower seeds in the entire South. Our warehouses are filled to the roofs with thousands of bags of the choicest seeds, produced especially for us under contract with the foremost seed breeders and growers in all parts of the world. We attempt, as far as humanly possible, to carry in stock at all times a sufficient quantity of every single variety offered in this catalog, so that all of your orders will be filled promptly and completely. Reuter urges you to make this immense, carefully selected stock the one dependable source of your entire seed supply.

AIR-CONDITIONED STORAGE

We have installed in our own building the most modern, air-cooled, vermin-proof seed storage rooms. You will always find our seeds are of the highest germination, not only because every pound is fresh, new-crop stock, and not only because they are always painstakingly tested by a graduate Seed Analyst, but germination and vitality are maintained through these controlled temperatures and humidities in our seed storage rooms, which were designed for the sole purpose of storing our seeds under the most ideal conditions. Reuter has expended thousands of dollars in the latest equipment for this control of temperature and humidity to doubly assure you of receiving only seeds of strongest vitality and highest germination.

Hace Your Orde

We desire to call to the attention of our many friends and customers that our industry, like many others, in the past 3 years has been confronted with a serious shortage of manpower. This handicap, combined with overtaxed transportation facilities, may cause a delay in the arrival of your seed orders. We, therefore, urge you as far as possible to anticipate your requirements. Send us your orders early allowing a reasonable time for filling and for any delay which may occur in transit. All possible advance preparations have been made for the Spring season, and we want to assure you that we will do everything within our power to fill your orders completely and quickly. Your co-operation will be very much appreciated.

Prefer rich, sandy soil and plenty of sunshine. When the ground has become thoroughly warm, spade in well-rotted manure about ½ foot deep, at the rate of a shovelful for each hill. Drop 8 to 10 seeds in slightly raised hills 4 to 6 feet apart each way, covering with ½ to 1 inch of fine soil. When plants have produced their rough leaves, thin to the 3 or 4 strongest in each hill. Practice frequent shallow cultivation until vines cover ground. Commercial growers start the seed in hotbeds, in paper pots, or dirt-bands (write for prices) and later transplant to the field. Earlier plantings can be accomplished by the use of Hofkaps (see first pink page in rear of catalog). For fungous diseases in general, spray frequently with Bordeaux Mixture or Pyrox (see page 64): for "damping off," dust with flowers of sulphur when the vines are young, and maintain good drainage and clean cultivation.

HOW TO GROW 'EM

Rich sandy loam soils are considered best for Watermelons, but good crops are grown on any well-drained, fertile soil. Adding well-rotted manure to soil gives the plants a good start, and to commercial growers we recommend an application of 600 to 800 pounds of commercial fertilizer (analyzing about 5 per cent ammonia, 7 per cent phosphoric acid, and 3 per cent potash) to the acre. Space hills at least 10 feet apart. This method will give about 360 hills to the acre. When the soil has become warm, drop 6 to 8 seeds in each hill and cover about 1 inch. Later thin to 2 to 3 of the largest plants. Earlier crops may be obtained by protecting the young plants with Hotkaps (see rear of catalog). One ounce will plant 25 hills; 1½ to 2 pounds per acre.

WONDERMELON

607 85 days. Originated and introduced by Reuter. Without a doubt, the finest Watermelon ever developed for home and nearby market use. In quality and flavor, there is nothing offered today that will compare to it. Its sparkling, rich, bright-scarlet flesh—right up to its thin, tough rind—has a delectable flavor. The luscious, large, solid, red heart is melting and absolutely free from cores and hard centers.

The melon itself is uniformly heavy, oblong, often 22 inches in length. Average weight is 30 to 50 pounds, although specimen fruits weighing 75 to 100 pounds have been grown. The color of the rind is a rich, glossy, bluish-green with small crease-like markings.

606 85 days. A sensational new Watermelon of outstanding merit. The size is not unduly large, yet under proper methods of culture, melons weighing 50 pounds or more are not unusual. The sparkling crisp red flesh is deliciously sweet clear to the rind. It is solid, with very few small white seeds. The outer skin is light green, striped and blotched with dark green, rather tough, and does not bruise easily. A good shipping melon because of the texture of the skin and the strength of the rind, and it will travel to distant markets and arrive in perfect condition. Produces sturdy, strong vines that carry a larger number of melons—it will produce earlier and outyield most other varieties. It has all the good qualities demanded by commercial growers, and is perfectly adapted to the smaller home-garden. Genuine small white-seeded. With the discovery of its valuable health-giving vitamins, Lettuce has become a year-round table necessity. It is so easily grown that no garden need be without a generous supply.

Culture. Lettuce requires a rich soil, plenty of moisture, and a quick, steady growth from the time seeds are planted until the heads are ready for use. The most common causes of failure to get Lettuce to head properly are too late planting and not giving the plants sufficient room for developing. Lettuce seed is difficult to germinate in hot weather. We suggest the seed be first soaked in ice-water for an hour, then wrapped in dampened paper or cheese-cloth and placed in the refrigerator for 10 to 12 hours prior to planting. Spread seed out on dry paper in shade and dry slightly. Immediately broadcast on good moist seed-bed, or sow 8 to 10 inches apart in rows 15 to 18 inches apart, covering with less than ½ inch of fine soil. One ounce will sow 150 feet of row; 2 to 3 pounds, an acre.

Cultural Direction

Select a location where your Roses will get the sun at least 5 or 6 hours a day. They do best in a slightly acid ground, and if your soil is alkaline it is advisable to give the rose beds an application of aluminum sulphate before setting out the bushes. Broadcast this material over the surface at the rate of 10 pounds per 100 square feet, and mix it into the soil by spading. For easy cultivation and cutting of flowers do not make your rose beds more than 3 feet wide, and set your bushes 1½ feet apart each way.

apart each way.

About the end of February the Rôse Bushes should be pruned. Cut the plants back to about 12 inches, remove all dead wood and weak and unproductive growth. Climbing Roses, if cut back at all, should be pruned about the beginning of July. Some growers object to severe pruning, in which case remove only the dead wood or unproductive growth. growth.

growth.

Give your first application of plant food about the middle of February and continue monthly until June. Apply one closed handful to each bush sprinkled over the surface and watered down. Spraying is very necessary to protect the plants from Black Spot, Mildew and Insects. Triogen or Nicotine Pyrox are probably the most efficient of all the spray materials as they control the fungus and kill all types of insects.

D. AND P. L. (Deltapine 14) FOUNDATION PLANTING COTTON SEED

TRADE MARK Reg. U. S. Patent Office

DELTAPINE 14

We are now offering Breeder's Registered Deltapine 14 planting seed with the assurance that this is the most productive and thoroughly satisfactory variety yet introduced. It has proved more productive with a somewhat longer staple and a larger boll than has either Deltapine 12 or Deltapine 11-A, to which it is related and similar.

The spinning quality of this cotton has been tested by the United States Department of Agriculture and the results were released in a report of May, 1942, and reads as follows: "Deltapine 14. Very low percentage of manufacturing waste and strong yarns of good appearance combine to make this an outstanding variety in the test. This sample was found superior to strain 12 in almost every respect."

Deltapine 14 has been tested thoroughly at Scott during the past four years, 1938-41, and it has outyielded all other varieties that have been tried for that period. In the four years Deltapine 14 has been compared with Deltapine 12 in ten separate variety and strain tests. In all but one of these ten tests Deltapine 14 outyielded Deltapine 12, with an average increase of 4.8%. The average lint percentage was practically the same, differing by 3/10 of one percentage point and the average length of staple was 35/32nds for Deltapine 14 against 34.3/32nds for Deltapine 12 as classed by the Staple Cotton Cooperative Association. A portion of the 1941 crop of Deltapine 14 was classed as 1½ but this is predominately 1 3/32 cotton. From 5% to 10% fewer bolls of Deltapine 14 are required to make a pound of seed cotton or lint than of Deltapine 12.

ALYCE CLOVER

727 This revolutionizing new clover should be on every farm in the South. Like Lespedeza it is a summer annual reseeding each fall and volunteering the next summer, but grows twice as tall and furnishes much more hay or pasture of finer quality feeding value and palatability. When cut early for hay a second growth will produce a seed crop, 350 to 600 pounds per acre. Cut hay in early bloom and rake as soon as drying permits. It dries readily and can be baled the day following harvesting. Grows well in shade of wooded pastures or orchards. Has more root nodules than Crotalaria and is 50% better for soil improvement. Does well in acid soil if not too yet. Resistant to insects, diseases, heat and drought. Makes 2-4 tons hay per acre. Seeded on Bermuda, Dallis, Carpet or other grass sods it furnishes nitrogen that is lacking in Southern soils, and doubles the growth of grass. It has 4 times more calcium, twice as much phosphorus and 2½ times as much protein as Carpet Grass, When cows graze on it their milk flow increases. Plant during spring and early summer at the rate of 10-12 lbs. per acre broadcast. Inoculate seed with Nitragin E. Write for free cultural leaflet. Lb. 55c; 5 lbs. \$2.35. 732 The earliest of the annual Lespedezas. The earliest of the annual Lespedezas. The abundant growth, deep penetrating roots covered with nodules makes Korean Lespedeza an outstanding grazing and soil-building legume. It makes larger growth than the Common, 15 to 24 inches, single plants having a spread of 3 feet; has larger leaves, furnishes pasturage three weeks earlier. It is highly resistant to drought, and thrives on poor, worn-out soils where alfalfa and clovers fail.

Holds its leaves well and produces a full crop the first season. It is an annual, reseeds indefinitely although closely grazed. It is highly recommended for the upper South where the seasons are shorter and the sun less severe. Korean is especially good for sections with short growing seasons, because it matures its seed crop earlier than the others. It produces on all soil types where the common varieties grow, but in producing Korean for hay, fertile soil will give much greater return. If Korean is used in permanent pasture mixtures, the seed may be planted with other grasses and clovers in the spring, using from 5 to 10 pounds of seed per acre. When sown alone broadcast 25 lbs. to the acre. February and March are the best months to plant. Lb. 30c; 5 lbs. \$1.25. For larger quantities, see price-list in back of catalog.

733 The most widely-grown variety. Does well over a wider territory than other varieties. The most important pasture legume in the South. Increases carrying capacity of pasture lands from 25 to 50%. Grows on poor soils, including acid types, and supplies grazing during the summer and fall months when most pasture plants are suffering from hot sun. On good soil will produce an excellent growth, and reaches a height of from 18 to 30 inches. The small stems of the plant make it an easily cured hay crop. Seed should be planted on a well-prepared but firm seed bed in February or March. On grazing crops sow 10 to 15 pounds per acre. When planted alone for hay crop sow 25 pounds. Lb. 55c; 5 lbs. \$2.50. For larger qualities, see price-list in backer catalog.

GREAT SOIL BUILDING CROPS CAOTALATIA

OUR CROTALARIA SEED IS SCARIFIED

Reuter's Crotalaria seed is handpicked, machine cleaned and cured in the most approved manner. Our reputation stands back of every bag we sell. The seed has a purity of 98% or more and germination of 90% or better. In recent test plantings, properly cured and scarified seed produced eight times as many plants per square yard as compared to ordinary field-run, non-scarified seed.

885-A Spectabilis, Early Strain.

A new early strain in every way equal to the common variety, but matures three weeks earlier and more dwarf in growth. Makes nearly as heavy a tonnage. Can be sown from March until July. More desirable for planting in fruit and pecan orchards and will mature seed and can be plowed under before the nuts fall. Customers in upper South should plant this type. Lb. 35c; 5 lbs. \$1.45. Not prepaid: 10 lbs. \$2.00; 100 lbs. \$18.50.

able new summer cover crop and soil builder yielding 40.000 pounds of green weight per acre. The humus produced by such yield is of tremendous value. When turned under is the equivalent of 800 pounds of Nitrate of Soda. It is not recommended for hay. Requires no fertilization, no lining, no inoculation. Reseeds itself under favorable conditions. Broadcast just before the last cultivation of cotton or corn. It will just about double the crop yields following it. Thrives on any soil. Broadcast 10 to 15 pounds on well-prepared land from March through June, harrowing in not over 2 inches, while the soil is moist. Lb. 35c; 5 lbs. \$1.45. Not prepaid: 10 lbs. \$2.00; 100 lbs. \$18.50.

10 lbs. \$2.00; 100 lbs. \$18.50.

885-B Intermedia. The only Crotalaria that is relished by live-stock. Furnishes several cuttings of hay. The long, thin leaves are of fine quality. It's two weeks earlier than the Spectabilis. Grows much the same as the other two types described above: is adapted to sandy loam soils, but does well on high ground. It requires about 3 to 5 pounds to sow an acre planted in rows 3 to 3½ feet apart. It to 10 pounds broadcasted. Seed should be planted 1½ to 2 inches deep as soon as danger of frost is past. Cultivate the same as corn. Makes a splendid cover crop to plow under. Lb. 45c; 5 lbs. \$1.90. Not prepaid: 10 lbs. \$3.00, 100 lbs. \$28.00.

summer growing fertilizer crop.
Loosens and emulsifies the soil. Citrus growers in the Imperial and Rio Grande Valley have found it superior to all other fertilizer crops, making more tonnage, quicker growth and shading the young trees during hot weather. Florida citrus growers are commencing to plant it liberally. Trucker growers are planting it in a bigger way. It requires from 8 to 10 weeks from time of germination to time of plowing under. It should be plowed under when the seed is in the dough. Attains a height of from 8 to 10 feet. Individual plants will make a limb spread of from 4 to 6 feet. The foliage is like an acacia, with finely cut small leaves. They decay very rapidly. The root growth is very rapid, as much as 3 feet from tip to tip, and 18 inches deep in eight weeks. They are entirely covered with nodules. It has no known value other than as a fertilizer crop, or for game preserves. Quail are very fond of the seed, which are produced in abundance, and are capable of lying on the ground a long while, and remaining in good condition. Citrus growers usually drill 30 lbs. of seed to the acre, between the trees. Trucker growers should sow 40 lbs. per acre and give a light covering. Cotton and corn farmers have found Sesbania the solution of keeping up their soils, sowing at the rate of 12 to 20 lbs. per acre. For the period of growth, we know of no legume which is equal as a producer of nitrogen and humus. Cultivation readily kills it. Plant only scarified seed that germinates readily. Lb. 35c; 5 lbs. \$1.45. Not prepaid: 10 lbs. \$2.20; 100 lbs. \$20.00.

Peanuts are a profitable "cash" crop. Easily grown on any soil. In addition to the nuts, the hay is superior to alfalfa as it contains more fats and is equal in protein. An excellent soil-improver. Shell the seed before planting, but where there is sufficient moisture this practice is not necessary. If planted in corn, 30 pounds will plant 4 acres; planted alone, 30 to 40 pounds in 2½- to 3-foot rows, dropping seed in hills 8 to 10 inches apart. Cover 1 to 2 inches deep. In the fall when they have matured, turn the hogs into the field, and they will feed on them all winter except when the ground is wet or frozen. They are more productive than potatoes. Yields of 700 bushels have been grown on an acre of good land, but 300 to 400 bushels is nearer the average crop. Although grown principally for hogs, they are fine food for cattle, sheep and horses. MAMLOXI

704 (Matures in 130 days.) A Mammoth Yellow and Biloxi, developed by the Delta Experiment Station. It's the highest producing of all strains tested at the station, having produced above 50 bushels per acre. It is much better than Biloxi for hay, grazing, planting in corn and soil building. Shatters less than any other variety. Mamloxi is the best edible Soy Bean other variety, and should be considered in our food production program. Sow 2 bushels per acre broadproduction program. Sow 2 bushels per acre.

100 FINS

709 (Matures in 170 days.) The most popular main-crop hay and soil-improving Soy Bean. Compared with cowpeas, one-fourth the amount of seed will produce double the amount of hay. Compared to velvet beans, it makes a better cover-crop, does not over-run trees or fences, and can be cut for-hay if wanted. There is no legume that will put as much humus and nitrogen combined into the soil. Produces 4 to 6 tons of dry hay, or 10 to 15 tons of green forage per acre, and surpasses alfalfa in feed-value. When grown for seed, you can expect 15 to 20 bushels per acre. Grows over a long period and is seldom affected by wet or dry weather. Less liable to shatter than other sorts. It cures quickly, and for hay and grain combined it has no equal. Plant in rows 2½ to 3 feet apart, 4 to 8 inches apart in drill. A bushel will plant 3 to 4 acres solid, or from 6 to 8 acres in corn middles, Lb. 30c; 2 lbs. 55c; 5 lbs. \$1.15. Write for larger quantity prices.

quality of hay; the leaves and stems are of medium size. The plants are semi-viney and cover the ground well throughout the Summer and Fall, thus making it an excellent variety to hold weeds in check when planted in corn. On less fertile soil, the plants grow erect, while the branches have twining terminals. The height of plant or length of vine is approximately 6 feet. The plant is well branched (average 17 branches per plant at Baton Rouge). The Palmetto has produced three tons in tests at Baton Rouge. The seed is straw yellow with black hilum, and of medium size, 3736 to the pound. This variety appears satisfactory for general use as forage and for soil improvement when yellow seed is desired. 708 (Matures in 165 days.)

A rank-growing late variety.

It takes longer than some to mature its grain but makes a whale of a plant. Planted in rows with corn for silage it usually grows 6 feet high. For grazing, for hogging down with corn, and for soiling, it is unexcelled. It is an erect, upstanding plant having no runners. This means something to the orchardist who wants a cover-crop to cover the ground only. Makes good hay if planted late in 3-foot rows, and thick enough in the drill to subdue its natural growth. It's a great hog and cattle Bean. Best results when planted in rows from 3 to 5 feet wide. Yields from 10 to 15 tons of green forage per acre. Will stand a lot of wet and a lot of drought. Does well on stiff, heavy soils, and on the light sandy soils. One bushel plants 1½ to 2 acres. Lb. 25c; 2 lbs. 40c; 5 lbs. 85c.

706 Matures in 170 days. A new type that is widely and successfully grown in Louisiana. The leaves and stems are large and coarse and the plant is a semi-viny, bushy type. The seeds are dull black and slightly larger than the O-too-tans. It produced 25 to 30 bushels of seed per acre. Yields over 3 tons of cured hay per acre. Louisiana planters prefer it to the O-too-tans because the Soy Bean caterpillars show a preference for O-too-tans when both are grown in the same field. Makes a fine feed for work- and beef-stock and dairy cattle. Adds beef-stock and improves its

mechanical condition. There is no cheaper way to improve land than by growing Cowpeas.

Cowpeas can be planted any time from April until August, broadcast or in drills 3 to 4 feet apart. Cultivate two or three times. Broadcast, 1 to 2 bushels are required per acre, and 2 to 3 peeks for seeding in drills. Inoculate your seed for best results.
